RESOLUTION NO. 4-97

A RESOLUTION AMENDING MONTEZUMA COUNTY RESOLUTION NUMBER 86-1 AS TO INDIVIDUAL SEWAGE DISPOSAL SYSTEMS WITHIN THE 100 YEAR FLOOD PLAIN TO SIXTEEN (16) FEET ABOVE SAID FLOOD PLAIN ALONG THE DOLORES RIVER AND THE WEST FORK OF THE DOLORES RIVER.

WHEREAS, the Board of County Commissioners of Montezuma County, State of Colorado, finds that maintaining the water quality in the Dolores River and the West Fork of the Dolores River is necessary for the preservation of the public health and safety;

NOW THEREFORE BE IT RESOLVED by the Board of County Commissioners of Montezuma County pursuant to 25-10-101, C.R.S., et seq., that Montezuma County Resolution Number 86-1 is amended as follows:

1. That within the 100 year flood plain to an elevation of sixteen (16) feet above said Flood Plain along the Dolores River and the West Fork of the Dolores River, a sewage system must be designed by a Registered professional engineer as defined in 25-10-103(16), C.R.S., and based upon the permitted volume of sewage, the system shall be one of the following or a combination thereof as appropriate:

   (a) A vault for limited use only. A watertight covered receptacle which is designed to receive and store excreta or wastes either from a sewer or from a privy. After the contents have been pumped out of said vault, said contents must be hauled to a treatment plant for further processing.

   (b) Septic Tanks and Evapotranspiration Beds. Septic tanks are designed based on the number of bedrooms and the number of plumbing fixtures. The required evapotranspiration bed size is a level area lined with 20 to 30 mil P.V.C. liner filled with clean sand. Said liner must be guaranteed by the manufacturer to last the projected life of the system. All the septic tank effluent evaporates so it is a "no discharge" system. They can have only limited landscaping. Leak testing is required throughout the life of the system.

   (c) Septic Tank Followed by a Mound System. An absorption system that is installed above the original grade of the ground. Because the material that makes up the mound is imported the Engineer designing the system can predict how the effluent percolating through it will react.

   (d) Composting Toilets With Gray Water Systems. A unit which consists of a toilet seat and cover over a riser which connects to a compartment or a vault that contains or will receive composting materials sufficient to reduce waste by aerobic decomposition. Composting toilets are used in conjunction with a gray water system. Because 40% of water used in the normal house involves toilet flushing, the gray water system needs only 60% of the leach area that would ordinarily be required. However gray water must be handled in the same manner as sewage.
(e) Intermittent Sand Filter with Underdrain. This system involves pumping septic tank effluent to the top of a clean sand filter. An underdrain system collects the effluent and pumps it to a subsurface percolation system with small diameter pipes. A typical system consists of a 1200 to 1500 gallon septic tank, a S.T.E.P. pump inside the system that pumps only 1" to 2" of effluent from the clear zone of the septic tank to a 10' x 36' x 36' deep flush with the ground lined sand filter. An underdrain system flows to a sump where a pump is used to pressure distribute the clean effluent to a subsurface leach field.

2. This resolution is necessary for the immediate preservation of the public peace, health, and safety.

3. This resolution shall be effective immediately upon adoption.

NOW THEREFORE BE IT RESOLVED that this resolution is hereby adopted.

RESOLUTION NO. 4-97

A RESOLUTION AMENDING MONTEZUMA COUNTY RESOLUTION NUMBER 86-1 AS TO INDIVIDUAL SEWAGE DISPOSAL SYSTEMS WITHIN THE 100 YEAR FLOOD PLAIN TO SIXTEEN (16) FEET ABOVE SAID FLOOD PLAIN ALONG THE DOLORES RIVER AND THE WEST FORK OF THE DOLORES RIVER.

WHEREAS, the Board of County Commissioners of Montezuma County, State of Colorado, finds that maintaining the water quality in the Dolores River and the West Fork of the Dolores River is necessary for the preservation of the public health and safety;

NOW THEREFORE BE IT RESOLVED by the Board of County Commissioners of Montezuma County pursuant to 25-10-101, C.R.S., et seq., that Montezuma County Resolution Number 86-1 is amended as follows:

1. That within the 100 year flood plain to an elevation of sixteen (16) feet above said Flood Plain along the Dolores River and the West Fork of the Dolores River, a sewage system must be designed by a Registered professional engineer as defined in 25-10-103(16), C.R.S., and based upon the permitted volume of sewage, the system shall be one of the following or a combination thereof as appropriate:

(a) A vault for limited use only. A watertight covered receptacle which is designed to receive and store excreta or wastes either from a sewer or from a privy. After the contents have been pumped out of said vault, said contents must be hauled to a treatment plant for further processing.

(b) Septic Tanks and Evapotranspiration Beds. Septic tanks are designed based on the number of bedrooms and the number of plumbing fixtures. The required evapotranspiration bed size is a level area lined with 20 to 30 mil P.V.C. liner filled with clean sand. Said liner must be guaranteed by the manufacturer to last the projected life of the system. All the septic tank effluent evaporates so it is a "no discharge" system. They can have only limited landscaping. Leak testing is required throughout the life of the system.

(c) Septic Tank Followed by a Mound System. An absorption system that is installed above the original grade of the ground. Because the material that makes up the mound is imported the Engineer designing the system can predict how the effluent percolating through it will react.

(d) Composting Toilets With Gray Water Systems. A unit which consists of a toilet seat and cover over a riser which connects to a compartment or a vault that contains or will receive composting materials sufficient to reduce waste by aerobic decomposition. Composting toilets are used in conjunction with a gray water system. Because 40% of water used in the normal house involves toilet flushing, the gray water system needs only 60% of the leach area that would ordinarily be required. However gray water must be handled in the same manner as sewage.
(e) Intermittent Sand Filter with Underdrain. This system involves pumping septic tank effluent to the top of a clean sand filter. An underdrain system collects the effluent and pumps it to a subsurface percolation system with small diameter pipes. A typical system consists of a 1200 to 1500 gallon septic tank, a S.T.E.P. pump inside the system that pumps only 1" to 2" of effluent from the clear zone of the septic tank to a 10' x 36' x 36' deep flush with the ground lined sand filter. An underdrain system flows to a sump where a pump is used to pressure distribute the clean effluent to a subsurface leach field.

2. This resolution is necessary for the immediate preservation of the public peace, health, and safety.

3. This resolution shall be effective immediately upon adoption.

NOW THEREFORE BE IT RESOLVED that this resolution is hereby adopted.
